THE QUESTION

WHAT IF A JOURNAL LIVED IN SPACE?

Fieldnotes turns an investigator journal into a world-space interface: evidence floats forward, context stays readable, and every action contributes to reconstructing a mystery.

INSPECT
CONNECT
RECONSTRUCT

The design combines spatial-computing principles, 3D object study and game-interface clarity inside a working Unity prototype.

FOUNDATION

FROM BLUEPRINT TO PLAYABLE

The supplied blueprint defined a bounded investigator-journal direction. The Unity project supplied a clean technical base. Fieldnotes turned both into an authored, reviewable experience.

Ownership: project direction, spatial UI/UX, interaction model, Unity implementation, iteration and presentation by Jaikar Pothula / Jaikar Studio.

EXPERIENCE LOOP

FOLLOW THE EVIDENCE

A compact interaction loop keeps the mystery legible while giving the user control over a 3D clue.

SPATIAL ANATOMY

ONE VIEW.
THREE LAYERS.

Design principle: depth earns its place. The object moves toward attention; the journal remains a dependable reading surface; the room gives context without competing with the task.

WORLD-SPACE CANVAS

3D OBJECT STUDY

CLEAR HIERARCHY

INFORMATION SYSTEM

MEMORY FOR THE MYSTERY

- EVIDENCE**
3 clues
- CONNECTIONS**
saved state
- CASE NOTES**
timeline
- SETTINGS**
reduced motion

PlayerPrefs preserves evidence connections and motion preference. Navigation, reset, zoom and modal states make the prototype useful across more than one moment of interaction.

UI / UX LANGUAGE

DESIGNED TO FEEL SPATIAL

UNITY IMPLEMENTATION

DESIGN THAT RUNS

01

EvidenceRecord

Data for clue identity, category, place, time and observation.

02

InvestigatorExperience

Builds the world-space UI, room, 3D evidence and interaction states.

03

SpatialAction

Shared activation plus desktop pointer and focus feedback.

04

InvestigatorSetup

Entry scene, build setup, captures and focused Editor checks.

C#

WORLD-SPACE UI

PROCEDURAL 3D

PERSISTENCE

BUILD + QA

VALIDATION

BUILT. CHECKED. REFINED.

0

WINDOWS BUILD ERRORS

VERIFIED

Evidence selection / connections / case notes /
Settings / reduced motion / saved state /
world-space canvas / launched Windows render.

ITERATION LOG

- 01 Corrected geometry winding and material handling.
- 02 Reduced the key scale to protect label hierarchy.
- 03 Darkened the room and strengthened active-tab states.
- 04 Added a modal backdrop and repaired a stale text reference.

Validation boundary: the standalone build was launch/render checked. Native PolySpatial, gaze/pinch, simulator, headset comfort and sustained performance validation remain future work.

NEXT HORIZON

DESKTOP TODAY. VISIONOS NEXT.

Fieldnotes proves the interaction model in Unity. The next stage turns that proof into a native spatial-computing build.

- 01 Install compatible visionOS Build Support and PolySpatial.
- 02 Configure a bounded Volume Camera and RealityKit rendering.
- 03 Integrate native pinch, hover and platform materials.
- 04 Export with Xcode; validate simulator, hardware and comfort.
